

# File Storage Problem Statement

## Problem Statement:

People need a way to automatically clear up storage from devices while keeping important files and deleting other outdated files. It can be a tedious process to manually delete files especially if they keep coming in.

## Who:

This is especially prevalent for people who store large amounts of photography or video on their computer and keep getting new video or photos. The amount coming in on average or just the total amount coming in is tedious to remove. This is also a problem with people who store clips or videos of them playing games on their computer as it is often very space intensive.

## Why:

This is a problem because too often people let this fill up their storage before dealing with the issue and leave way too many unneeded files on their computer. Which means their computer will either eventually start running slower or they will need to manually sort through and delete things.

## The need to be solved:

There is a need for this to be solved due to the lack of tools available to non-technical users. Typically if you wish to accomplish the same thing on windows you would need to use scripting and it has a high barrier to use.
